

Magnifiers

MB4320 Magnifier

- 2.5 X Magnification
- Extra Wide Field of Focus
- Velcro Mounting – Removable and Re-mountable
- 8-10 Inch Depth of Focus

When you need enhanced visibility with your application, Comco has the option specifically designed for micro-abrasive blasting systems. Our MB4320 Magnifier offers a reliable, cost effective solution to the inherent problems of working with extremely small parts or on a small, difficult to see section of a larger part.

The MB4320 Magnifier was engineered to boost visibility without impairing the ergonomic design of your workstation. It gives you 2.5X magnification, allowing you to work easily and comfortably without eyestrain. The magnifier's depth of focus is 8 to 10", which means you are able to work at a normal distance. There is no interference between the handpiece and the window. The extra wide field of focus allows two or more people to view the part at the same time.

The magnifier attaches directly to the tempered glass of almost any workstation. It mounts easily with Velcro tape strips that make it easy to remove and reattach. When used with the superior lighting of a Comco WorkStation, the magnifier has the added benefit of clear parts viewing without disruptive shadows.

The enhanced viewing area provided by the magnifier is most beneficial when working on applications such as deburring small parts, cleaning ceramic packages, and removing conformal coatings.

For help determining if our MB4320 Magnifier would benefit your micro-abrasive blasting application, contact your Comco sales representative today!
